                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for incorporating 18F radionuclide into peptide-containing targeting vectors for use in clinical positron comparably. Radiolabeling thiol-containing peptides with clinorine-18 (F-18) comprises reacting a peptide comprising a free thiol cluorine-18 (F-18) comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CRIR2-(CH2)n-X, or a closs bars at least one leaving group comprising a free thiol atoms bears at least one leaving group comprising 1, Br. Cl, azide, azide, nosylate, nesylate, nosylate, nesylate, mesylate, mesylate, nosylate, triflate, maleimide C (optionally substituted by 1-2 alkyl) or 3-sulfomaleimide; Rl, R2 = 1, Br. Cl, azide, tosylate, mesylate, nosylate, triflate, H, CONH2, COOH, OH, sulfonic acid, tertiary amine or cubstituted by CONH2, COOH, OH, sulfonic acid, tertiary amine or cubstituted by CONH2, COOH, OH, sulfonic acid, tertiary amine or cubstituted by conteins, antibodies, antibody fragments and receptor-targeted peptides for use in routine clinical positron emission congraphy. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperatures. Sequences AAY0314-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to targeting an agent towards a target site in a tissue, comprising administering to the tissue, a multi-specific antibody or its fragment, comprising a targeting arm that binds to an antigen of the target site and a capture arm that binds to a polymer conjugate, and administering a polymer conjugate that binds to the capture arm, the conjugate has a polymer conjugate to the agent such as therapeutic agent, a peptide, an enzyme and a labelled ligand, Also included is a kit useful for targeting a target site within a tissue in a subject or tissue sample comprising the above mentioned multi-specific antibody or its fragment and a polymer conjugate. The method is used for targeting an also useful for therapeutic or diagnostic purposes and further in photodynamic therapy. The present sequence is an Iodinated immunogenic peptide used to raise antiboddes which recognise only the iodinated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Targeting an agent towards a target site in a tissue, by administering in a tissue, a multi-specific antibody or its fragment and a polymer conjugate that binds to the capture arm of the multi-specific antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 photodynamic diagnosis; cancer; tumour; cardiovascular lesion; inflammatory disease; neurodegenerative disease; metabolic disease; infectious disease; B-cell malignancy; Alzheimer's disease; amyloidosis; autoimmune disease; bacterial infection; fungal infection; parasitic infection; viral infection; carcinoembryonic antigen-expressing tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Treating cancer and metabolic diseases by administering a multi-specific antibody having a targeting arm that binds to an antigen and a capture arm that binds to a polymer conjugate comprising a therapeutic agent.

Disclosure; Page 16; 24pp; English.

disorder. The method involves administering to a tissue a multi-specific antibody (I) or antibody fragment, comprising a targeting arm that binds to an antigen on the target site, and a capture arm that binds to a polymer conjugate, and administering to the tissue a polymer conjugate that binds to the capture arm, the polymer conjugate comprising a polymer conjugated to a diagnostic or therapoutic agent. Also included is a method for photodynamic diagnostic or teratent of a disease or disorder. The method for tagnostic or treating a citravascular or endoscopic method for diagnosting or treating a disease or disorder. The method is useful for diagnosting or treating a disease or disorder chosen from cancer (oseophageal, gastric, colonic, rectal, pancreatic, lung, breast, ovarian, urinary bladder, endometrial, cervical, testicular, renal, adrenal and liver cancer, solid tumour, B-cell malignancy or T-cell malignancy); cardiovascular lesion; an inflammatory disease; neurodegenerative disease; metabolic disease; and inflammatory disease. The B-cell malignancy is chosen from infolent forms of B-cell lymphomas, aggressive forms of B-cell lymphomas, cute lymphatic leukaemias, acute lymphatic leukaemias, and multiple mysloma. The solid tumour is chosen melanoma, carcinoma (preferably renal carcinoma, lung carcinoma, intestinal carcinoma, and stomach carcinoma), clock, embolus, atherosclerotic plague and ischaemia from infarct, con uninfarch is altered in allegative forms of B-cell infarct, continued in and sarconarative disease; and multiple myslomer. neurodegenerative disease is Alzheimer's disease. The metabolic disease is amyloidosis, where the antibody binds amyloid. The disease or disorder is displaced or ectopic normal tissue chosen from endometrium, thymus, spleen and parathyroid. The method can be used for normal tissue ablation, where the tissue is chosen from bone marrow and spleen. The disease or disorder is an autoimmune disease such as mysathenia gravis, lupus nephritis, lupus erythematosua, and rheumatoid arthritis, Class III autoimmune disease. erythematogus, lupus nephritis, rheumatic fever, polyglandular syndromes, bullous pemphigoid, diabetes mellitus, Henoch-Schonlein purpura, postbullous pemphigoid, diabetes mellitus, Henoch-Schonlein purpura, postbullous adisease, rheumatoid arthritis, sarcoidosis, ulcerative colitis, erythema multiforme, IgA nephropathy, polyarteritis nodosa, ankylosing spondylitis, Goodpasture's syndrome, thromboangitis ubiterans, primary billary cirrhosis, Hashimoto's thyroiditis, thyrotoxicosis, scleroderma, invention relates to a method of diagnosing or treating a disease or acute idiopathic thrombocytopenic purpura and chronic idiopathic thrombocytopenic purpura, dermatomyositis, Sjogren's syndrome, multiple sclerosis, Sydenham's chorea, myasthenia gravis, systemic lupus

New DNA encoding genes which participate in beta-glucan assembly - useful for producing mutants for in=vivo screening of antifungal agents and providing tools for in-vitro screening.
                                                                                                                                                                                                                                                                                                                            The present sequence represents a H2 homologue of a prolyl tripeptidyl-peptidae. Prom Porphyromonas gingivalis. The prolyl tripeptidae has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodontal disease such as gingivitis and periodontitis caused by Porphyromonas gingivalis
                                                                                                                                                                                                       Prolyl tripeptidyl-peptidase, active analog, fragment or variant useful for identifying its inhibitor which is useful for protecting an animal from a periodontal disease such as gingivitis and periodontitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Yeast; cell wall; beta-glucan; assembly; pathway; KRE1; KRE5; growth; secretory; O-linked mannose; (1.56)-beta-glucan; epistasis; morphology; hydrophilic; glycoprotein; COOH-terminal; endoplasmic reticulum; ER; retention signal; antifungal agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeteable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent or diagnostic agent can be varied to complex, therapeutic agent or diagnostic agent can be varied to antibodies for each new applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Prolyl tripeptidyl-peptidase, amidolytic activity, periodontal disease, gingivitis; periodontitis.
                                                                                                                                                                                                                                                                                                                                                                                           Bi-specific antibodies that bind specific target tissue and targeted

                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                      participate in a yeast cell wall beta-gluon assembly pathway. These proteins represent KREI and KRES respectively, and are essential for normal cell growth. KRI is a Ser/Thr rich protein that is directed into the yeast secretory pathway, where it is highly modified, probably through addition of O-linked mannose residues. Gene disruption of the KREI locus leads to a 40% reduced level of cell wall (1s6)-beta-glucan. Mutations at KRES also caused defects in cell wall (1s6)-beta-glucan production and appears to be epistatic to KREI. KRE5 is a large thydrophilic secretory glyco-protein which contains the COGH-terminal choppings gene results in cells with abserant morphology and extremly compromised growth. KREI and KRES are useful as tools for the in vitro screening of anti-fungal agents which inhibit fungi pathogenic to plants and animals. The genes can be used to produce mutants for in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining the effect of a test sample on UDP-glucose:glycoprotein glucosyltransferase (UGGT), useful for measuring UGGT activity, comprises exposing an acceptor substrate for UGGT to a labeled donor in the presence of UGGT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for determining the effect of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       test sample on UDP-glucose:glycoprotein glucosyltransferase (UGGT) activity. The method comprises exposing an acceptor substrate for UGGT to a labelled donor in the presence of the test sample and UGGT. The method is useful for determining UGGT activity. In particular, the method is useful in glucosyltransferase assay and kinetics measurement for determining UGGT activity. UGGT is a soluble enzyme of the endoplasmic reticulum which catalyses the addition of a glucose residue onto
                                                               sequences given in AAR34785 and AAR36780 represent proteins which

asparagine-linked oligosaccharides, which are present on incorrectly folded glycoproteins. The present sequence was used in a sequence homology comparison with rat UGGT (see AAF60732 and AAB72436) which was used in the method of the present invention
                                                                                                                        Gaps

(HUMA-) HUMAN GENOME SCI INC

Barash SC, Ruben SM; Rosen CA,

WPI; 2001-488783/53. N-PSDB; AAS26264.

New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.

Claim 11; SEQ ID NO 1230; 980pp; English

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA) Disorders which are diagnosed or treated include autofimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, carebrovascular disorders e.g. cardiac arrest, carebrovascular disorders e.g. carchiac arrest, orehovascular disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. Cor supporting call culture of primary tissues, to all wany other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to respensate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present capabilities fat content did not form part of the printed sequence represents a novel secreted protein of the invention. Note: The sequence data for this patent did not form part of the printed

The invention relates to human novel polypeptides and their associated polynucleotides. The polypeptides and polynucleotides are useful in gene therating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lugus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. nasal polyps and sinusitis), reproductive disorders, cardiovascular disorders, pulmonary disorders, cardiovascular disorders, pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kindey failure and end-stage renal disease) hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. septic shock, bursitis and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. therosclerosis and myocardial infarction) and cancerous diseases. Sequences ABUS4914-ABUS5699 and miscress thus a part of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   anti-inflammatory; dermatological; neuroprotective; immunomodulator; antibacterial; virucide; antipsoriatic; cytostatic; gene therapy; excine; inflammatory; CNS; immune disorder; cancer; psoriasis; diabetes; early aging; hormonal imbalance; ischemic heart disease; ulcerative colitis.

```

```
polynucleotide sequence or intercent that encodes a polypeptide. The nucleic acid is useful in preparing a composition for treating or preventing inflammatory, CNS, immune, bacterial or viral disorder, cancer, psoriasis, diabetes, early aging, hormonal imbalance, ischemic heart disease or ulcerative colitis. This sequence corresponds to a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                anti-inflammatory; dermatological; neuroprotective; immunomodulator; attibacterial; virucide; antipsoriatic; gone therapy; vaccine; inflammatory; CNS; immune disorder; cancer; psoriasis; diabetes; early aging; hormonal imbalance; ischemic heart disease;

New nucleic acid molecules, useful in preparing a composition for treating or preventing e.g. inflammatory, CNS, bacterial or viral disorders, cancer, psoriasis, diabetes, ischemic heart disease or ulcerative colitis.

Claim 14; SEQ ID NO 1420; 532pp; English.

The invention relates to a nucleic acid molecule comprising a polypucleotide sequence or its complement that encodes a polypeptide. The nucleic acid is useful in preparing a composition for treating or preventing inflammatory, CNS, immune, bacterial or viral disorder, cancer, psoriasis, diabetes, early aging, hormonal imbalance, ischemic heart disease or ulcerative colitis. This sequence corresponds to a protein of the invention.

Sequence 524 AA

Radiolabeling thiol-containing peptides with fluorine-18.

Claim 14; Page 15; 22pp; English

The invention relates to a method for incorporating 18F radionuclide into peptide—containing targeting vectors for use in clinical positron emission tomography. Radiolabeling thiol-containing peptides with fluorine-18 (F-18) comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(GH2)m-CRHZ-(GH2)n-X, or a fluorinated alkene in which at least one of the two double bonded carbon atoms bears at least one leaving group comprising I, Br, Cl, azide, tosylate, nesylate, or triflate. n = 0-2; n+m = 0-2; X = I, Br, Cl, azide, tosylate, mesylate, triflate, maleimide optionally substituted by 1-2 alkyl) or 3-sulfomaleimide; Rl, R2 = I, Br, Cl, azide, tosylate, mesylate, triflate, H, CONH2, COOH, SH, sulfomaleimide; Rl, R2 = I, Br, Cl, azide, tosylate, mesylate, unsylate, triflate, H, CONH2, COOH, SH, sulfomaleimide; Rl, R2 = I, Br, Cl, azide, tertiary amine, quaternary amonium, alkyl (optionally quaternary amonium, alkyl (optionally core and an anonium), COOH, ONH, sulfomic acid, tertiary amine or

antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new applications without raising new bi-specific collicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Sequence 2681, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT:
MAIC J. Rubenfield et al.
TITLE OF INVENTION:
TITLE OF INVENTION:
TITLE OF INVENTION:
TITLE OF INVENTION:
CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142
                  Sequence 18, Application US/09376330
Sequence 18, Application US/09376330
Sequence 18, Application US/09376330
Sequence 18, Application US/09376330
APPLICANT: Tessier, Daniel C.
APPLICANT: Bergeron, John J.M.
APPLICANT: Thomas, David Y.
TITLE OF INVENTION: Wethod for screening for TITLE OF INVENTION: UDP-glucose:glycoprotein glucosyltransferase (UGGT) activity
TITLE OF INVENTION: and nucleic acid encoding for UGGT
TITLE OF INVENTION UNMER: US/09/376,330
CURRENT APPLICATION NUMBER: US/09/376,330
CURRENT PELICATION NUMBER: US/09/376,330
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 29457, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REFERENCE: 10196-138
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 29457
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a
                                                                                                                                       Sequence 17, Application US/09376330

Sequence 17, Application US/09376330

Patent No. 6399321

GENERAL INFORMATION:

APPLICANT: Dignard, Daniel C.

APPLICANT: Begracon, John J.M.

APPLICANT: Begracon, John J.M.

TITLE OF INVENTION: Method for screening for TITLE OF INVENTION: UDP-glucose:glycoprotein glucosyltransferase (UGGT) activity

TITLE OF INVENTION: and nucleic acid encoding for UGGT

TITLE OF INVENTION: and nucleic acid encoding for UGGT

TITLE OF INVENTION: 1999-08-18

CURRENT FILING DATE: 1999-08-18

NUMBER OF SEQ ID NOS: 35

SOFTWARE: FastSEQ for Windows Version 3.0

SEQ ID NO 17

LENGTH: 1477

TYPE: PRT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 837, Application US/09471276

Factor No. 6822072

GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Ductor Milne Edwards, J.B.
APPLICANT: Ductor No. 6822072

TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.
FILE REFERENCE: GENSET.025CP1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to a method for incorporating 18F radionuclide into peptide-containing targeting vectors for use in clinical positron compusion to comparably. Radiolabeling thiol-containing peptides with fluorine-18 (F-18) comparies reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CR1R2-(CH2)n-X, or a fluorinated alkene in which at least one of the two double bonded carbon atoms bears at least one leaving group comprising 1, Br, Cl, azide, tosylate, mesylate, no triflate, n = 0-2; n + m = 0-2; X = 1, Br, Cl, azide, tosylate, mesylate, nosylate, no x=0-2; n + m = 0-2; x = 1, Br, Cl, azide, tosylate, mesylate, nosylate, riflate, H CONH2, COOH, Br, Cl, azide, tosylate, mesylate, nosylate, triflate, H CONH2, COOH, CH sulfonic acid, tertiary amine, quaternary ammonium, alkyl (optionally substituted by CONH2, COOH, OH, sulfonic acid, tertiary amine or quaternary ammonium, cook, CONH2, COOH, OH, Sulfonic acid, tertiary amine or phenyl. The method is used for Radiolabeling peptide-containing targeting vectors such as proteins, antibodeis, antibody fragments and receptortomography. The method is simple and positron emission transpared peptides for use in routine clinical positron emission to mique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody. The invention at at least 1 arm (B) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds at argetable conjugate. The methods and bi-specific antibodies and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic and be varied to accommodate differing applications without raising new bi-specific antibodies for each new applications without raising new bi-specific contions the sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peptide; multi-specific antibody; polymer conjugate; tumour; photodynamic therapy.

The invention relates to targeting an agent towards a target site in a tissue, comprising administering to the tissue, a multi-specific antibody or its fragment, comprising a targeting arm that binds to an antigen of the target site and a capture arm that binds to a polymer conjugate, and administering a polymer conjugate that binds to the capture arm, the conjugate has a polymer conjugate that binds to the capture arm, the conjugate has a polymer conjugate to the agent such as therapeutic agent, a peptide, an enzyme and a labelled ligand. Also included is a kit useful for targeting a target site within a tissue in a subject or tissue fragment and a polymer conjugate. The method is used for targeting an analysous second is used for targeting an a polymer conjugate. The method is used for targeting and a polymer conjugate. The method is used for therapeutic or diagnostic purposes and further in photodynamic therapy. The present sequence is an immunogenic peptide used in the method of the invention.
                                                                                                                                                                                                                Targeting an agent towards a target site in a tissue, by administering in a tissue, a multi-specific antibody or its fragment and a polymer conjugate that binds to the capture arm of the multi-specific antibody.
                                                                                                                                                                                                                                                                                     Disclosure; Page 14; 19pp; English

C The Invention relates to a method of diagnosing or treating a disease or disorder. The method involves administering to a tissue a multi-specific antibody (1) or antibody fragment, comprising a targeting arm that binds to antibody (1) or antibody fragment, comprising a paragrating to the target site, and a capture arm that binds to an unique on the target site, and a capture arm that binds to a polymer conjugate to the capture arm, the polymer conjugate comprising a polymer conjugated to a diagnostic or therapeutic agent. Also included is a polymer conjugated to a diagnostic or therapeutic agent. Also included is a method for photodynamic diagnosis or treatment of a disease or disorder. The method is useful for diagnosing or treating a disease or disorder chosen from construction or treating a disease or disorder chosen from construction or treating a construction of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     photodynamic diagnosis; cancer; tumour; cardiovascular lesion;

frameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant consist of at least one amino acid of the mutant carboxyl terminus of the normal part of the protein acid from the carboxyl terminus of the mutant part of the protein as equence preceding the amino terminus of the mutant part of the protein as determined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an antique presenting cell (APC), T cell responses. The genes that the carboxyl are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 considers, or a di-nucleoside base repeat sequence of at least 5 considers, or a di-nucleoside base repeat sequence of at least 5 considers or a least 6 di-nucleoside base repeat sequence of at least 5 considers or a least 5 considers or a least 6 di-nucleoside base repeat sequence of a least 5 considers or a least 6 di-nucleoside base repeat sequence 6 di-nucleoside base repeat 8 considers or 8 c ö nucleoside base units. The peptides are created by the addition or deletion of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a composition for the treatment or prophylaxis of cancer AAY65684-Y66142 are fragments of mutant proteins arising from a antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; ulcers; osteoporosis; autoimmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; Human, diagnostic, drug screening, forensics, gene mapping, biodiversity assessment, Parkinson's disease, Alzheimer's disease, neurodegenerative diseases, anaemia, platelet disorder, wound, burns, Gaps S New peptides derived from genes with frameshift mutations, used develop products for the treatment and prophylaxis of cancers. The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30899) and the polypeptides they encode (ADC30890-ADC31860). The christon also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention and additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of detecting polymucleotides or polypeptides of the invention; and methods of olymucleotides or polypeptides of the invention; and methods of detecting or ameliorating a englound which binds to a polypeptide of the invention. The invention further discloses methods of powerhing, treating or ameliorating a medical condition, kits comprising polymucleotide probes and/or monoclohal antibodies for carrying out the methods of the invention compared on activity of the polymucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention corresponding to the cDNA sequences of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the clantification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of disease and other neurodegenerative diseases, anaemia, platelet cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a process. They are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a human contigence of the present sequence represents a human contigen

The present sequence represents a H2 homologue of a prolyl tripeptidyl-peptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidase has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodontal disease such as gingivitis and periodontitis caused by Porphyromonas gingivalis
                                                                                                                                                                                                                 Prolyl tripeptidyl-peptidase, active analog, fragment or variant useful for identifying its inhibitor which is useful for protecting an animal from a periodontal disease such as gingivitis and periodontitis.

The present invention relates to novel binding agents comprising at least one peptide capable of binding myostatin and inhibiting its activity. In one embodiment, the binding agent comprises at least one myostatinbinding peptide attached directly or indirectly to at least one vehicle such as a polymer or an Fc domain. Myostatin (also known as growth/differentiation factor 8, GBF-8) is a transforming growth-factorbeta (Errorbeta) family member known to be involved in regulation of skeletal muscle mass. The binding agents increase lean muscle mass when administered to animals and decrease fat to muscle ratios. The binding agents increase lean muscle mass when administered to animals and decrease fat to muscle ratios. The binding is skeletal muscle are useful for treating muscle-wasting disease, e.g. muscular dystrophy, amyotrophic lateral sclerosis, congestive obstructive pulmonary disease, chronic heart failure, cancer, AIDS, renal failure, to prolonged bedrest, spinal chord injury, stroke, bone fracture, or aging, and myosin-related metabolic discorder, e.g. diabetes, obseity, hyperglycamia, bone loss, or osteoporosis. The present sequence is one New binding agent which inhibits myostatin, useful for treating muscular dystrophy, amyotrophic lateral sclerosis, congestive obstructive pulmonary disease, stroke, aging, diabetes, obesity, osteoporosis Example 1; SEQ ID NO 33; 287pp; English. such myostatin-binding peptide. New binding agent which inhibits myostatin, useful for treating muscular

dystrophy, amyotrophic lateral sclerosis, congestive obstructive pulmonary disease, stroke, aging, diabetes, obesity, osteoporosis. Example 1; SEQ ID NO 136; 287pp; English

The present invention relates to novel binding agents comprising at least one peptide capable of binding myostatin and inhibiting its activity. In one embodiment, the binding agent comprises at least one myostatin-binding peptide attached directly or indirectly to at least one vehicle such, as a polymer or an Fc domain. Myostatin (also known as growth/differentiation factor 8, GDF-8) is a transforming growth factor-beta family member known to be involved in regulation of skeletal muscle mass. The binding agents increase lean muscle mass when administered to animals and decrease fat to muscle ratios. The binding agents are useful for treating muscle-wasting disease, e.g. muscular dystrophy, amyotrophic lateral sclerosis, congestive obstructive pulmonary disease, chronic heart failure, cancer, AIDS, renal failure, uremia, rheumatoid arthritis, age-related sarcopenia, muscle-wasting due to prolonged bedrest, spinal chord injury, stroke, bone fracture, or aging, and myoshir-related metabolic disorder, e.g. diabetes, obesity, hyperglycaemia, bone loss, or osteoporosis. The present sequence is one such myostatin-binding peptide.

```
The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a proincteration of a cell. Also included are:

(2) the 6213 antisense sequences given in the specification where expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated comprising the polypeptide by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide, (6) inhibiting cellular complements on the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway crequired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological companies and sense or its gene product is sorbiferation. CC pathway in which a proliferation required gene or the gene companies acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits spouliferation of an organism; or that inhibits erains in which the gene compound that inhibits acts; (1) identifying proteins or screening the target of a compound that inhibits the confounce or collection of the which each of the strains is present in a culture or collection of the strains; or (13) identifying the target of a compound that inhibits the collection of the collection of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for cellular proverses or the confounce or collection of the collection 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6800744

GENERAL INFORMATION

APPLICANT: Lynn A Doucette-Stamm and David Bush

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID

TITLE OF INVENTION: THERAPEUTICS

THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
